

Dear Sir / Madam,

We are manufacturing vehicle installed radiocommunication devices including car entertainment systems (including WLAN and BT) and radar systems.

We would like to check if these devices have to get a mandatory type approval in order to be imported and used or not.

Can you therefore kindly answer the following questions:

1. Do such kind of transmitters require mandatory type approval?
If CE or FCC approved equipment does not need local type approval, please also let us know.
2. Do receiving only devices (e.g. FM tuner, GPS receiver) also require type approval?
3. Is there any label requirement and if not does the device need to have the CE or FCC label?
4. Can the label be placed instead in the vehicle owner's manual?
5. Can we as an international manufacturer also apply for type approval or will we need a local agent?
6. Can we find somewhere instructions how to apply for type approval?
7. What would be the price and lead time in order to obtain type approval?
8. Must the submitted test reports be for CE or FCC and in case of CE, will RF be sufficient or do we also need to provide EMC and safety test reports?
9. Is there a validity of the type approval or is it valid permanently?
10. In order to apply for type approval, do we need to provide test samples and if yes, how many?
(Please consider that CE or FCC test reports are available)

Thank you very much for your support.
